

Kruskal's Algorithm:

A connected, acyclic subgraph of a connected graph G that contains all of G 's vertices, with n vertices it always has exactly $n-1$ edge.

$$\frac{bc}{1}, \frac{ef}{2}, \frac{ab}{3}, \frac{bf}{4}, \frac{cf}{4}$$

$$\frac{af}{5}, \frac{de}{8}, \frac{ae}{6}, \frac{cd}{6}$$

total weight of MST = $1+2+3+4+5 = 15$

$$\frac{bd}{2}, \frac{ac}{5}, \frac{eg}{3}, \frac{ab}{4}, \frac{fg}{4}$$

$$\frac{bc}{3}, \frac{df}{8}, \frac{cf}{6}, \frac{cd}{7}, \frac{de}{9}$$

total weight of MST = $2+3+3+4+4+5 = 21$

$$\frac{uv}{1}, \frac{rv}{2}, \frac{pt}{3}, \frac{rs}{4}, \frac{qu}{5}$$

$$\frac{tu}{5}, \frac{pw}{6}, \frac{vw}{6}, \frac{qu}{7}, \frac{rw}{8}$$

so, total weight of MST = $1+2+3+4+5+5+6 = 26$
